Introduction

Background

In the age of Big Data, The Internet Of Things, Digitization of every business, Data has become the biggest valuable asset for anyone. And it's justly necessary to store it in an organized way such that it's easily accessible and secure. From this perspective, Databases are being used to store data in a structured manner.

Figure 1: Big Data

Problem Statement

- `Lack of Security and Privacy of Data`
  If your data is left unencrypted, any system administrator that has root privileges can see your content. Usually, companies look forward to your data so they can sell your data to other companies, suggest advertisements based on your data contents, and use it for their analysis.
- `Data Hack`
  It's not recommended to store your sensitive data on a centralized server that is financially profitable to get hacked.
- `Data Loss`
  Of course, you can always stick with local storage, But once they are lost, stolen, or most likely encrypted by ransomware, you cannot make a recovery.

Proposed Solution

The solution we propose for such a problem is to use a distributed database system that will store data in a peer-to-peer network where is no central authority with the right to modify or censor clients' data.

Furthermore

- Everything is encrypted before being uploaded.
- After being encrypted, each object is split into pieces.
- Object pieces are stored on different Nodes around the globe.
- Using Blockchain and smart contract for managing data integrity and trust.

Related Theory

- Public and Private Key Pairs
- Shamir's secret sharing Algorithm
- Hashing
- Blockchain

Methodology

Peer to Peer Network

Instead of establishing a new peer-to-peer Network, we are using IPFS Protocol.

What is the IPFS?

`IPFS`, The Interplanetary File System is a distributed system for storing and accessing files, applications, and websites. It is a worldwide peer-to-peer file-sharing system created by Protocol Labs. It is inspired by good ideas from BitTorrent, Git, and Kademlia.

.

Development Methodology

Software Development Approach

We have chosen the Scrum methodology. It's a popular way to implement agile, and it allows the team to deliver software regularly

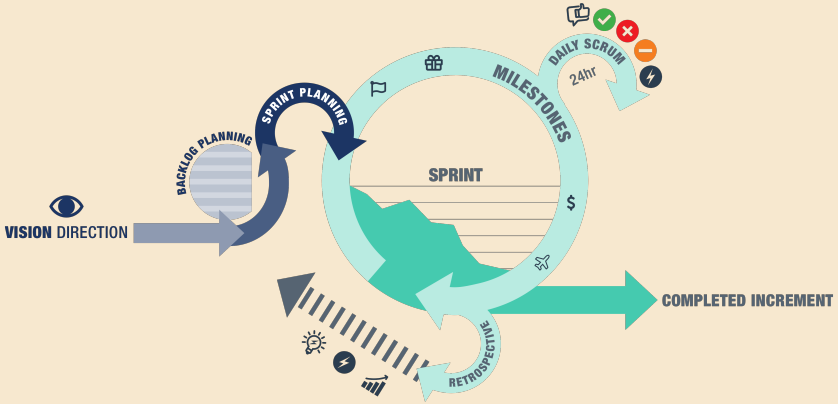

Figure 2: Scrum Methodology

Tools and Technologies

- Node.js
- Solidity
- Github Actions (CI/CD)
- Mocha (Unit Test)
- Rinkeby (Test Net)
- Git (Version Control)
- Jira (Issue Tracking)
- Next.js (React.js Framework)
- Hardhat (Solidity Framework)
- Docker (Deployment)
- ESLint (Linting code base)
- Ethers (Library)
- Github (Remote Repository)
- Infura

Conclusion

Summary

You deserve to live a sustainable, private, self-sufficient and independent life, don't let anyone take this from you.

Thanks!
